

Science- Human Body. Week 12 Day 1

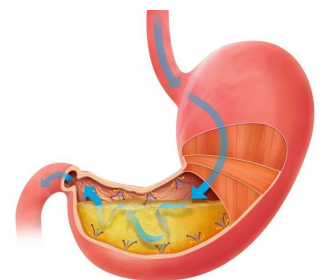

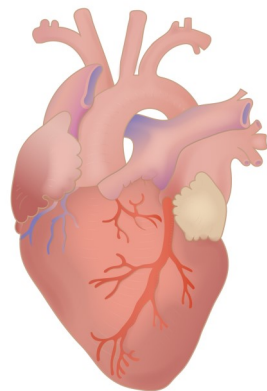

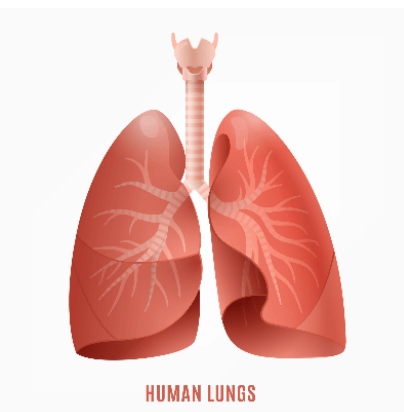

For Science this week we want you to think about the human body!

Within the human body we have 78 organs! Organs each have really important jobs to keep our bodies functioning.

Can you name any organs?

Below are some pictures of the main organs in our bodies.

Your first task is to name these organs and see if you can point to where they are on your body- you could even label them on your body and send us a picture on Seesaw!

Stomach

Lungs

Brain

Heart

Science- Human Body. Week 12 Day 1

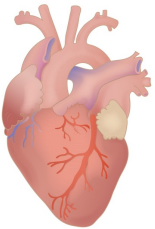

Now you've named and labelled the organs in your body, we need to find out what they do and why they are so important!

Do you know what the 4 different organs do?

Lungs

The lungs take in Oxygen and help you to breath.

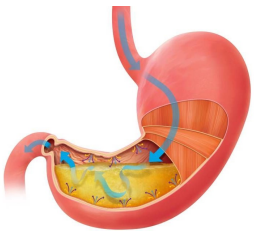

Heart

The heart pumps blood around your body.

Brain

The brain controls everything your body does.

Stomach

The stomach helps to break down food.

Now you know what the organs do. Your second task is tell us what they do! You could do this by drawing a diagram, writing a fact file or even making a video describing what the organs do!

To support you with this there are lots of fun songs on YouTube (Kids Learning Tube)

called Human body for kids/_____ song/ Human body systems.
